Overall assessment

Result: Strong battery health

The car's own battery computer reports 95.7% state of health. That is an estimated 44.3 kWh of usable capacity, against 46.3 kWh when new. Cell voltage difference was 11 mV, measured between 3.564 V and 3.575 V at 10% state of charge.

Vehicle and test details

Make	**Peugeot**
Model	**e-208**
VIN	**VR3UHZKXZNT012345**
Registration	**DEMO**
First registered	**28 July 2022**
Model year	**2022**
Recorded mileage	**63,736 miles**
Odometer (from the car)	**19,712 miles**
Pack conditions	**10% charge | 16 to 17 °C**

Battery data

Cells read	**108, every cell**
Lowest cell	**3.564 V (cell 17)**
Highest cell	**3.575 V (cell 11)**
Cell voltage difference	**11 mV**
Pack voltage	**386.2 V**
Pack current	**0.8 A**
Insulation resistance	**6,540 kOhm**
Battery temperature	**16 to 17 °C**

Battery capacity

Battery version	**50 kWh (136 hp)**
Usable capacity when new	**46.3 kWh**
Nominal capacity when new	**50.0 kWh**
Estimated usable capacity now	**44.3 kWh**

44.3 of 46.3 kWh (95.7%)

Capacity now is an estimate: the capacity when new multiplied by the state of health.

Manufacturer battery warranty

Provider	**Peugeot**
Mileage limit	**100,000 miles**
Time limit	**8 years**
Warranty status	**In warranty period**
Remaining time	**3 years, 9 months**
Remaining miles	**36,264 miles**

Indicative only, based on the time limit, the date first registered and the mileage. Check the maker's own terms.

Estimated real-world electric range

Modelled estimates, from the official (WLTP) range when new (217 miles), the battery health and typical real-world factors. Actual range will vary with temperature, speed, terrain, vehicle load and driving style.

Driving condition	Summer	Winter
Urban driving	**190 miles**	**155 miles**
Mixed driving	**171 miles**	**142 miles**
Motorway driving	**152 miles**	**129 miles**

Conclusion and scope

At the point of testing, the car's own battery computer reported 95.7% state of health. The car's SoH figure stops at 100%. By date and mileage, the car is shown as within the maker's battery warranty period, with 3 years, 9 months and 36,264 miles remaining. This is a point-in-time assessment for information purposes and should be considered alongside service history, warning lights and a general vehicle inspection.

DEMO CERTIFICATE, NOT A REAL CAR

Cell voltage balance

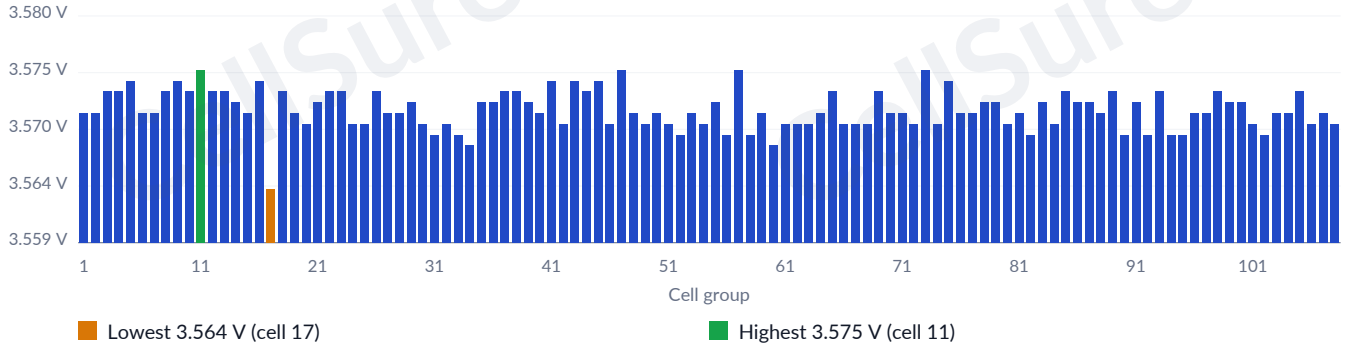

Peugeot e-208 | DEMO

TEST DATE **11 November 2026, 12:44** CERTIFICATE ID **CS-DEMO-7K4M9Q2X** TESTED BY **CellSure**

Demo data: replies recorded from a real car by OBDb. Not a test by CellSure.

Cell voltage balance

Every cell group's voltage, as read from the car (108 in all). The lowest was 3.564 V and the highest 3.575 V, a difference of 11 mV. The scale starts at 3.559 V, not 0 V, so small differences show clearly.

Voltage difference between cells

Lowest cell	3.564 V
Highest cell	3.575 V

This measures how evenly the battery's cells are balanced. The bar runs from 0 to 100 mV.

Battery pack data

Cell readings

Cells read	108, every cell
Cell group count	108
Lowest cell	3.564 V (cell 17)
Highest cell	3.575 V (cell 11)
Cell voltage difference	11 mV

Battery capacity

Battery version	50 kWh (136 hp)
Usable when new	46.3 kWh
Nominal when new	50.0 kWh
Estimated usable now	44.3 kWh
Capacity retention	95.7%

Charge and energy

State of charge	10%
Energy left in the battery	12.1 kWh

Cooling / temperature

Battery temperature	16 to 17 °C
Pack temperature	16 to 17 °C

Enclosure insulation

Insulation resistance	6,540 kOhm

High-voltage junction

Pack voltage	386.2 V
Pack current	0.8 A

Pack current is the current flowing in or out of the battery at the moment of reading, as the car reports it.

How this was measured

DEMO: these figures are replies recorded from a real car by OBDb, played back by the CellSure Battery Reader. No car was tested. This page only shows how a certificate looks.
